#### VIA ELECTRONIC FILING

M. Lynn Jarvis, Chief Clerk North Carolina Utilities Commission 4325 Mail Service Center Raleigh, North Carolina 27699-4300

#### RE: 2017 Smart Grid Technology Plans of Duke Energy Carolinas, LLC and Duke Energy Progress, LLC Docket No. E-100, Sub 147

Dear Ms. Jarvis:

Pursuant to Commission Rule R8-60.1, I enclose the 2017 Smart Grid Technology Plan Updates (collectively, the "SGTP Updates") of Duke Energy Carolinas, LLC ("DEC") and Duke Energy Progress, LLC ("DEP") (collectively, the "Companies") for filing in connection with the referenced matter.

Portions of the cost/benefit appendices to the DEC and DEP SGTP Updates contain confidential information that should be protected from disclosure. Of the exhibits contained in Appendix C, Exhibit B to the DEC SGTP Update and Exhibits B, E and G to the DEP SGTP Update contain cost information for installations currently underway or planned in the near future. Public disclosure of this information would impair the Companies' ability to procure equipment and services necessary to initiate future projects on advantageous terms for the benefit of its customers. Thus, the Companies respectfully request that the confidential information be treated confidentially pursuant to N.C. Gen. Stat. §132-1.2. DEC and DEP will make this information available to other parties pursuant to an appropriate confidentiality agreement.

Thank you for your attention to this matter. If you have any questions, please let me know.

Lawrence B. Somers

Enclosures

### Overview

As required by the North Carolina Utilities Commission (NCUC or Commission) Rule R8-60.1(b), Duke Energy Carolinas (DEC or Company) submits its 2017 Smart Grid Technology Plan (SGTP) Update. The 2017 SGTP Update represents the significant amendments or revisions to the 2016 Smart Grid Technology Plan.

### 1. Smart Grid Technology Strategy

Reference	Requirement
R8-60.1(c)(1)	A summary of the utility's strategy for evaluating and developing smart grid technologies.

#### **Power/Forward Carolinas Grid Improvement Plan**

Announced in 2017, the Company outlined its plans over the next decade to modernize the North Carolina grid. Power/Forward Carolinas is comprised of strategic programs that will each play a part in building a smarter energy future for customers. These strategic programs represent the means to deliver the Road Ahead strategies of modernizing the power grid and transforming the customer experience, as outlined in the 2016 SGTP. The early years of Power/Forward Carolinas will establish the foundational and enabling infrastructure and technologies to achieve the Company's long-term objectives of a more reliable, resilient grid to better serve customers.

Certain programs included in the Power/Forward Carolinas initiative are technologies that fall under the definition of "smart grid technologies" outlined in Commission Rule R8-60.1(c), while others are not. All of the programs have similar objectives in the long term, improving reliability and resiliency of the grid; however, certain programs, like Targeted Undergrounding, are not deemed smart grid technologies. The Company has determined that the Self-Optimizing Grid, and certain portions of the Enterprise Systems Upgrades, Communications Network Upgrades and Transmission Improvements programs, meet the criteria for the SGTP and will be outlined within the Plans each year as applicable. The Enterprise Systems Upgrades primarily consists of the Distribution Management System (DMS) Consolidation projects as outlined in the 2016 SGTP. Applicable projects or initiatives are included in the 2017 SGTP Update, or will be included in future SGTPs as appropriate.

These strategic programs may be comprised of multiple gated projects and annuallyfunded work streams to accomplish the end state objectives. Each year, the Company funds and prioritizes the work efforts through the annual budgeting process, and the following governing bodies provide oversight of the portfolio: management teams, steering teams, and the financial management committee.

Cross-functional management teams aligned around the strategic programs provide program and project governance, gating and change request oversight. The management teams are also responsible for deployment performance, business readiness, issue resolution, and benefit tracking and reporting. Steering teams provide strategic oversight of all programs and projects to ensure alignment with enterprise, regulatory, financial, customer and operational strategies. Steering teams are responsible for portfolio performance, alignment with the grid improvement plan, cross-functional issue resolution (if escalated from the management teams) and to review and approve significant changes in the overall strategy. Finally, the financial management committee tracks the expenditures of the organizational budgets set forth by the Company. The committee also manages the reallocation of funding within the programs and projects to maintain budgetary compliance and determines available funding for emergent work, change requests, or any other item that has a financial impact to the organization.

The initial planning for the 10-year Grid Improvement Plan was completed in early 2017. Given this is a 10-year plan, the company will utilize a "progressive elaboration" process, pursuant to Project Management Institute best practices, to govern the plan throughout the lifecycle. In this process, the initial overall 10-year plan concepts are approved first, then a more detailed version of each year's plan is submitted and approved annually.

#### **Stakeholder Outreach**

#### Collaborative Initiatives

Through the North Carolina Public Benefits Funds, administered by Advanced Energy and Duke Energy, along with generous technical support from North Carolina's Electric Membership Cooperatives, Duke Energy and Dominion Energy North Carolina, there have been several smart grid stakeholder education initiatives.

As described in the 2016 Smart Grid Technology Plan, Advanced Energy's outreach efforts are being designed to help our state's residents make well-informed energy decisions. They want to share information about new technologies and services when they believe they can offer value, and they also want to share any concerns that may present risk. Highlights of the accomplishments over the past year include:

• Hosted a facilitated cross-sector planning meeting in November 2016 to identify priority audiences and energy related topics to focus educational and outreach efforts for 2017.

The key audiences identified by the stakeholders were: state legislators, utilities commissioners, county commissioners, municipal staff, public staff and large business customers.

- Identified a webinar series as the most efficient and flexible delivery method for the outreach and education body of work for the priority NC stakeholder audiences identified.
- The overarching goal of the webinar series was to build awareness among the targeted key decision makers on relevant smart grid topics and their effects on technology, economic development, and policy across North Carolina.

2017 NC Smart Grid Webinar Series

- 1. Smart Grid Basics (presented April 26, 2017)
- 2. Solar Power and Grid Integration (presented May 24, 2017)
- 3. Smart Meters and Advanced Metering Infrastructure (presented June 22, 2017)
- 4. Microgrids and Grid Resiliency (presented September 20, 2017)
- 5. Self-Optimizing Grid (scheduled October 24, 2017)
- Created a publicly accessible website, <u>www.NCSmartGrid.org</u>, hosted and maintained by Advanced Energy. This site contains a repository of smart grid resources, presentation collateral and video links that can be used by stakeholders state-wide. Recordings of the NC Smart Grid Webinar Series are available through the NC Smart Grid website as an ongoing resource for stakeholders.
- Future engagement activities include plans to convene a facilitated stakeholder session in November 2017, similar to that which took place in November 2016, to gather scoping input for 2018 education and outreach work.

# 2. Improving Reliability and Security of the Grid

Reference	Requirement
<i>R8-60.1(c)(2)</i>	A description of how the proposed smart grid technology plan will improve reliability and
	security of the grid.

The description for each new technology project listed under Sections 3 through 5, and the specific benefits described, outline the impacts each project will have on the reliability and security of the grid. Additionally, the grid improvement plan as a whole will provide synergies resulting in greater overall value in improving grid security, reliability and resiliency, while also creating greater efficiencies and improving safety and sustainability.

One of the primary objectives of the Power/Forward Carolinas grid improvement plan is to reduce outages. When outages do occur, the goal is to reduce the time customers are without power. There are additional objectives that will address the physical and cyber security of the grid through specific programs, and also as an ancillary result of other programs. While some of these programs may not fall into the definition of smart grid technologies, all are designed to play a vital role in modernizing the grid.

## 3. Current and Scheduled Technology Deployments

Reference	Requ	irement
R8-60.1(c)(3)		<i>l</i> smart grid technologies currently being deployed or scheduled for implementation the next five years: $(i) - (vii)$

#### **DEC AMI Deployment**

DEC submitted the May 5, 2017 Supplemental Information filing in Docket No. E-100, Sub 147 to the 2016 Smart Grid Technology Plans outlining its AMI deployment.

(*i*) A description of the technologies, including the goals and objectives of each technology, options for ensuring interoperability of the technology with the legacy system, and the expected life of the technology.

AMI is the foundational investment that will enable enhanced customer solutions - giving customers greater control, convenience and choice over their energy usage, while also giving customers the opportunity to budget, save time and save money. AMI technology allows a utility to gather more granular usage data and utilize new capabilities to offer new programs and services to customers that are not achievable through existing meters. The AMI technology will pave the way for programs that will allow customers to stay better informed during outages, control their due dates, avoid deposits, to be reconnected faster, and to better understand and take control of their energy usage, and ultimately, their bills. Over time, the Company also expects AMI meters to contribute to cost reductions from reduced truck rolls in the years after deployments.

Deployment of AMI meters allows customers to start, stop and move service without the need for a technician visit. The AMI meters also provide an interface for customers to see and understand their hourly energy usage, allowing them to better manage their consumption and, as a result, their bills. AMI meters will enable future customer programs such as outage notification alerts, mid-billing cycle usage alerts, a real-time usage application for smart phones, and the ability for customers to select their payment due date. The technology can also enable future energy efficiency options and potential time-of-use rate offerings as well as pre-payment programs. Current meters cannot provide these capabilities.

These new meters are directly interoperable with the existing AMI meter systems and have a planned life of approximately 15 years.

(ii) The status and timeframe for completion.

Through August 2017, DEC has installed a total of approximately 850,000 AMI meters in NC. Current plans for DEC NC installations total approximately 1.1 million additional meters through 2019.

(iii) A description of any existing equipment to be rendered obsolete by the new technology, its anticipated book value at time of retirement, alternative uses of the existing equipment, and the expected salvage value of the existing equipment.

DEC will be removing and replacing approximately 1.32 million AMR (Automated Meter Reading - "drive-by") meters over the three-year period beginning in 2017 and ending in 2019. The estimated salvage value of those meters is \$1.37 M. The remaining net book value of the meters being removed is estimated at \$127.66 M as of March 31, 2017.

# (*iv*) A description of how the utility intends the technology to transfer information between it and the customer while maintaining the security of that information.

AMI meters capture energy usage and send it to grid routers directly, through range extenders, or through other meters to form a radio frequency (RF) mesh network. The grid routers transmit collected usage data to the AMI headend system via cellular backhaul once each day. The head-end system acts as the data collection point inbound from the metering infrastructure, as well as providing meter command and encryption key management outbound. The data is then sent to a Meter Data Management (MDM) system which provides billing determinants to the customer billing system for billing.

The data collected by the AMI meter utilizes a unique meter number (not displayed on the meter face) and thereby contains no personally identifiable customer information. All data is encrypted at the meter and decrypted at head-end system. The meter number is then used as the linkage to other information within the customer billing systems.

See additional information covered in Section 7(iv) and Appendix B related to how the utility provides usage information to customers through the secure online customer portal and billing statements.

(v) A description of how third parties will implement or utilize any portion of the technology, including transfers of customer-specific information from the utility to third parties, and how customers will authorize that information for release by the utility to third parties.

This section is not applicable as this project does not currently involve the transfer of customer information to any third-parties. Refer to Appendix B for general information on providing data to customers and third parties.

(vi) Approximate timing and amount of capital expenditures, including those already incurred.

DEC has incurred approximately \$144.8 million in capital through August 2017 on the AMI deployment project covering both its North and South Carolina service territories. The

Company estimates an additional \$41.8 million through year end 2017, and forecasts the following capital expenditures through the completion of the AMI deployment in 2019.

		Actuals	Forecast for		
	2016	through	Sep. – Dec.	2018	2019
<b>DEC AMI Capital Forecast</b>	Actuals	Aug. 2017	2017	Forecast	Forecast
Annual Capital \$ (millions)	\$54.5	\$90.3	\$41.8	\$93.8	\$11.6

(vii) Analyses relied upon by the utility for installations, including an explanation of the methodology and inputs used to perform the analyses.

The Cost-Benefit Analysis attached in Appendix C, Exhibit A is as presented to Company Management for consideration of the project. In evaluating the full scope of the AMI project, along with the approval of the DEC South Carolina portion of the AMI project, approval for the DEC North Carolina portion was not received until mid-November 2016. This Cost-Benefit Analysis represents total capital and operating expense deployment costs and operational benefits over a 20-year period, for the entire Duke Energy Carolinas service territory (North and South Carolina). The information presented in the high-level analysis in the 2016 SGTP was an estimated proportion of the total project costs and benefits allocated to North Carolina based on customer count. Many of the assumptions used for this analysis have now been either realized or discounted based on the detailed planning that has taken place since the final approval decision was made.

Based on updated plans for the DEC North Carolina AMI project, cost estimates for the remaining meter deployment project and necessary system scaling upgrades are estimated at approximately \$260 million. Additionally, part of the Company's strategy moving forward has been aligned with providing customers with more choice, convenience and control. Therefore, the ability to offer the enhanced customer services and programs as detailed in section *R8-60.1* (c)(3)(i) above, along with improvements in customer satisfaction, are some of the non-quantifiable benefits further supporting the Company's decision to move forward with a full AMI deployment.

For the cost-benefit analysis, see Appendix C, Exhibit A attached: **Duke Energy Carolinas Advanced Metering Infrastructure Cost Benefit Analysis**. For additional detail on the costs, see Exhibit B attached: **CONFIDENTIAL AMI Smart Meter Cost Inputs**. For additional detail on the benefits, see Exhibit C attached: **AMI Program Benefit Inputs and AMI Program Benefit Details**.

### Self-Optimizing Grid

(*i*) A description of the technologies, including the goals and objectives of each technology, options for ensuring interoperability of the technology with the legacy system, and the expected life of the technology.

The Self-Optimizing Grid (SOG) Program implements additional design criteria on distribution circuits that improves reliability and enhances system resiliency. This resiliency will enable the system to reduce outage duration from fault events. Key components of the projects will involve adding capacity to distribution circuits and substation transformers and connecting radial distribution circuits together with automated switches. The head-end enterprise systems such as the Self-Healing software and the Distribution Management System (DMS) software are essential to enabling this capability.

The Self-Optimizing Grid is an advancement from Self-Healing "Networks". The Self-Healing Networks and Feeder Segmentation projects were a foundational step in the progression towards the SOG program. Instead of having individual circuit pairs that can back each other up, the integrated grid network allows for multiple circuit rerouting options to re-energize segments and minimize customer outage events. The SOG program will further segment the circuits to minimize the number of customers affected by sustained outages and ensures the necessary capacity and connectivity to fully leverage the segmentation.

Under this program, circuits will have automated switches deployed according to the SOG guidelines, which outline automated switches approximately every 400 customers, or 3 miles in circuit segment length, or 2 MW peak load. The goal of the SOG program is to have 80% of customers served from circuits that have alternate power re-routing options and sufficient capacity to re-route power without being overloaded the majority of the time. Circuits that meet these additional guidelines will have SOG capabilities.

The SOG will automatically reroute power around a problem area, like an outage caused by a tree falling across a line, animal interference, or fault events. With this automation, the grid can self-identify problems and isolate affected areas by reconfiguring the circuits, which can shorten or even eliminate outages for many customers.

Automated switch equipment typically has an approximate 20-year expected life, and control and communications equipment, an approximate 5- to 7-year expected life.

#### (ii) The status and timeframe for completion.

The initial engineering, scoping and planning for the SOG program began in 2017 with expectations to begin field work in 2018. The initial planning will address activities in 2018 and the planning for following years will occur as part of the annual planning process. 2018 is the

first year of the expected 10-year program to achieve the anticipated goal of 80% of customers being served by the SOG.

(iii) A description of any existing equipment to be rendered obsolete by the new technology, its anticipated book value at time of retirement, alternative uses of the existing equipment, and the expected salvage value of the existing equipment.

During field work, installations will primarily consist of new equipment to achieve the new SOG guidelines. However, there will be instances where aged, automated switches, or other non-automated equipment will need to be replaced.

(*iv*) A description of how the utility intends the technology to transfer information between it and the customer while maintaining the security of that information.

This section is not applicable as this technology does not transfer information to/from customers.

(v) A description of how third parties will implement or utilize any portion of the technology, including transfers of customer-specific information from the utility to third parties, and how customers will authorize that information for release by the utility to third parties.

This section is not applicable as this technology does not transfer information to/from customers and will not be utilized by third-parties.

(vi) Approximate timing and amount of capital expenditures, including those already incurred.

Estimated costs through end of year 2017 are forecast to be approximately \$1.45 M for planning, scope identification and engineering. Forecast capital expenditures for the next five years are as follows:

DEC (Millions)	2018	2019	2020	2021	2022
Self-Optimizing Grid	\$103.8	\$152.1	\$153.0	\$164.9	\$164.6

(vii) Analyses relied upon by the utility for installations, including an explanation of the methodology and inputs used to perform the analyses.

Self-Optimizing Grid analysis uses the design criteria of segmenting the circuits for approximately 400 customers, 3 miles of circuit, or 2MW of load. Benefits can include:

- Reduces system-wide customers interrupted (CI) and customer minutes of interruption (CMI)
- Creates a networked energy system that improves operational situational awareness
- Minimizes the number of customers impacted by an outage
- Isolates problem areas for quicker mobilization and repair

- Shortens outage duration for impacted customers
- Automates system reconfigurations reducing the need for manual switching
- Improves grid resiliency and ability to recover from major events
- Enables the grid to effectively manage private distributed energy resources

#### **Usage Alerts**

(*i*) A description of the technologies, including the goals and objectives of each technology, options for ensuring interoperability of the technology with the legacy system, and the expected life of the technology.

The Usage Alerts program is designed to give customers increased transparency into their usage consumption. By leveraging smart meter data, this program will send customers an email at their mid-billing cycle indicating their actual usage to-date (showing kWh and dollars) and a projection of their end of cycle bill. This mid-cycle report also gives the customer increased choice and control by setting their preferences for receiving the data (email or text message) and setting their desired thresholds. Thresholds allow a customer to set their monthly spend target in dollars, and the usage alerts program will then communicate to a customer when they've reached 50%/75%/90%/100% of their set threshold amount. In these alerts, customers will also be able to see useful tips to allow them to be more efficient in their energy usage. The program is primarily designed for residential and small/medium business customers.

#### (ii) The status and timeframe for completion.

The Usage Alerts program was available to DEC customers with a smart meter in June 2017. As of early September 2017, the program has sent more than 602,000 messages to enrolled customers in DEC North Carolina. 95% of customers who responded to surveys have indicated their satisfaction with the program. The complete roll-out of the program is aligned with the deployment of AMI across the jurisdiction.

(iii) A description of any existing equipment to be rendered obsolete by the new technology, its anticipated book value at time of retirement, alternative uses of the existing equipment, and the expected salvage value of the existing equipment.

This section is not applicable.

(iv) A description of how the utility intends the technology to transfer information between it and the customer while maintaining the security of that information.

The Company works with a vendor partner to process usage alerts through text or email message based on customer preferences. Additionally, customers can update their method of receiving information through a preference center. The Company only transmits usage

information as agreed to by the customer, displaying street number and street name only to correlate it to an account.

(v) A description of how third parties will implement or utilize any portion of the technology, including transfers of customer-specific information from the utility to third parties, and how customers will authorize that information for release by the utility to third parties.

This section is not applicable.

(vi) Approximate timing and amount of capital expenditures, including those already incurred.

This program incurred no capital expenditures.

(vii) Analyses relied upon by the utility for installations, including an explanation of the methodology and inputs used to perform the analyses.

JD Power customer survey results indicate that customers are more satisfied when they have more detail regarding their usage patterns, and when they are not surprised by their bill.

#### Pick Your Own Due Date

(*i*) A description of the technologies, including the goals and objectives of each technology, options for ensuring interoperability of the technology with the legacy system, and the expected life of the technology.

The Pick Your Own Due Date (PYDD) program is designed to allow customers to choose the due date for their monthly bill. Primarily designed for residential and small and medium business customers, the program leverages smart meter data to give customers the choice of choosing a due date without creating meter reading inefficiencies. The customer can choose any date of the month, and can update their selection one time each year. Smart meters are required for enabling this program because they provide daily data enabling billing to occur on the date preferred by the customer, rather than one based off a pre-determined meter reading route schedule.

(ii) The status and timeframe for completion.

The PYDD program was available for DEC customers with a smart meter in March 2017. The program has assisted almost 4,000 DEC-NC residential customers and 140 DEC-NC non-residential customers. The complete roll-out of the program is associated with the full deployment of AMI.

(iii) A description of any existing equipment to be rendered obsolete by the new technology, its anticipated book value at time of retirement, alternative uses of the existing equipment, and the expected salvage value of the existing equipment.

This section is not applicable.

(*iv*) A description of how the utility intends the technology to transfer information between it and the customer while maintaining the security of that information.

This section is not applicable.

(v) A description of how third parties will implement or utilize any portion of the technology, including transfers of customer-specific information from the utility to third parties, and how customers will authorize that information for release by the utility to third parties.

This section is not applicable.

(vi) Approximate timing and amount of capital expenditures, including those already incurred.

This program incurred no capital expenditures.

(vii) Analyses relied upon by the utility for installations, including an explanation of the methodology and inputs used to perform the analyses.

JD Power customer survey results consistently indicate that customers are more satisfied when they have the option to pick their own due date.

## 4. Technologies Actively Under Consideration

Reference	Requirement
R8-60.1 (c) 4	For all smart grid technologies actively under consideration for implementation within the next
	five years, the smart grid technology plan shall include a description of the technologies,
	including the goals and objectives of the technologies, as well as a descriptive summary of any
	completed analysis used by the utility in assessing the smart grid technology.

#### **Enterprise Transmission Health & Risk Management Project**

Duke Energy's Transmission Operations manages over 32,200 miles of transmission lines, nearly 10,000 transformers, and nearly 15,000 circuit breakers. As the result of modernization and record keeping over many years, the Company has access to a significant amount of data, and has begun accelerated strategies to employ data analytics to assess the health and risk of failure of the equipment. This method will optimize the utilization of these assets in order to better monitor the operational and financial health of the equipment fleet. However, in the current environment the evaluation of the fleet cannot be performed in a comprehensive manner. The Transmission Asset Management organization is using antiquated tools and manual methods to understand equipment health and to predict and react to equipment failures.

Transmission Health and Risk Management (HRM) is a philosophy for how to manage assets. This philosophy is supported by software, monitoring, data, analytics, data science and people. This project will implement a new enterprise Health & Risk Management (HRM) platform to collect and analyze data to prescribe how Transmission can improve the management of its assets. The Company's strategy identifies condition monitoring as a key strategic program and this work aligns with the Road Ahead strategy of modernizing the power grid.

The selected HRM solution is an advanced analytics software package that helps utilities use a systematic, data-driven approach to assess the on-going health of assets, and take specific actions to improve overall system reliability. This enterprise project is estimated at approximately \$40 million and expected to be implemented over a four-year period, beginning by the end of 2017.

The HRM solution enables personnel to better manage Transmission transformer and breaker health, and capture significant value by:

- Reducing operating expenses by prioritizing replacement and maintenance actions
- Improving capital expense efficiency by prioritizing replacement and maintenance actions
- Improving customer value though improved reliability
- Reducing the likelihood of catastrophic transformer failures

**HRM** Project Objectives

- Implement a new Health and Risk Management platform
- Develop new HRM processes
- Become proactive versus reactive by shifting from an alarming model to a predictive model that incorporates the component, asset, fleet, and system health & risk data
- Extend the lifecycle of aging assets
- Reduce asset failures or catastrophic failures

#### **Enterprise Communications Network Upgrades Program**

#### Strategic Fiber and Wireless Transport

The backbone of Duke Energy's communications network (a.k.a. the 3rd Grid) is the transport network, which consists of fiber optical cable and microwave systems. A recent current state assessment identified 1,750 miles of fiber optic cable that needs to be evaluated for replacement (based on age) and several key fiber rings that are underperforming. Additionally, to satisfy business needs identified during the Enterprise Communications Strategy effort, Duke Energy will expand its fiber network to connect key generating plants, operations centers, substations and other critical facilities. Microwave systems are also used to provide high capacity connectivity. Many of Duke Energy's microwave systems in place today use network technology that is becoming obsolete, and the capacity of many microwave paths is not meeting business needs.

The Strategic Fiber and Wireless Transport work stream will begin replacing end-of-life fiber optic cable and microwave systems, add fiber to new, targeted routes based on business needs, and investigate alternatives to optical ground wire to enable Duke Energy to deploy fiber faster and less costly. The Enterprise Communications strategy concluded that to move to a smarter grid, the Company needed to:

- Treat communications as the 3rd Grid (e.g., an enterprise asset) and elevate communications to the same status as the electric grid and the gas grid
- Implement Broadband Internet Protocol from the core to the edge of the grid
- Make communications grid improvements that ensure: resiliency, reliability, security, capacity, and low latency. Fiber is one of the primary ways to enhance the entire communications grid.
- Expand network infrastructure, uplifting end-of-life technology and implementing a holistic network design

#### Grid Wide Area Network (WAN)

The Grid WAN initiative includes efforts to replace end-of-life data network hardware on the network core and in substations, and to convert substation hardware to Internet Protocol (IP). This work stream also includes redesigning existing networks for more capacity and better resiliency, and developing strategies for the Field Area Network (FAN) and Neighborhood Area Network (NAN).

A FAN strategy is being developed to support changes to grid communications due to the emergence of solar and battery storage, microgrids and distributed intelligence. A NAN strategy will also help to optimize the value of the AMI infrastructure by enabling other use cases such as lighting controls and demand response to benefit from its two-way mesh communications, in addition to scaling it for enterprise-wide AMI.

#### Next Generation Cellular

Duke Energy primarily uses a cellular vendor for cellular connections to substations, distribution line devices, AMI backhaul devices, direct-connect meters and load management switches. A significant number of these modems use 2G/3G technology which will be decommissioned by the cellular vendor by the end of 2022. Therefore, the Company will need to replace its 2G/3G cellular modems by the end of 2022. Some of these modems may be replaced by other efforts, such as the enterprise roll-out of AMI and the replacement of end-of-life substation routers; however, any remaining modems will be replaced as part of this work stream.

# 5. Technology Pilots and Initiatives

Reference	Requirement
R8-60.1 (c) 5	For each pilot project or initiative currently underway or planned within the next two years to
	evaluate smart grid technologies: $(i) - (v)$

At this time, the Company does not have any new pilot projects or initiatives to evaluate smart grid technologies.

## 6. Projects No Longer Being Considered

Reference	Requirement
R8-60.1 (c) 6	A description of each project or initiative described in a previous plan that is no longer under consideration by the utility, and the basis for the decision to end consideration of each project or initiative.

At this time, the Company does not have any projects or initiatives that are no longer under consideration.

# 7. Advanced Metering Infrastructure (AMI) Summary

Reference	Requirement
R8-60.1 (c) 7	For automated metering infrastructure (AMI), in addition to the information required in
	subsections (3) or (4) of this section, as appropriate, the utility shall also provide: $(i) - (iv)$

(i) A table indicating the extent to which AMI meters have been installed in the utility's service territory and specifically in North Carolina, the North Carolina jurisdictional customer classes and/or tariffs of customers with AMI, and the predicted lifespans of these installations. This table should indicate the number of AMI meters that has been installed both cumulatively and since the filing of the last smart grid technology plan.
(ii) The number of meters in North Carolina that use traditional metering technology and/or automated meter reading (AMR) technology, and the predicted lifespans for these installations.

			Walk-By &
<b>Customer Class</b>	<b>AMI Meters</b>	<b>AMR Meters</b>	<b>Other Meters</b>
NC Residential	680,173	1,045,641	3,149
NC Commercial	154,451	116,790	5,819
NC Industrial	7,422	1,122	1,659
NC Company	3,742	7,493	30
Use & Other			
Totals	845,788	1,171,046	10,657

### Meters installed in DEC North Carolina as of August 2017

DEC has installed approximately 318,397 AMI meters in NC since the information provided in the 2016 Smart Grid Technology Plan. The predicted lifespan of the AMI meters is approximately 15 years, and all other meters currently installed have a 15-20 year lifespan.

(*iii*) Any adjustment made by the utility to its capital accounting due to AMI, including the dollar amount of writedowns of its meter inventories.

In DEC North Carolina, the remaining book value of meters being retired through the AMI deployment is being deferred in a deferred debit account pending Commission approval in Docket No. E-7, Sub 1146 for the Company's request to include the amount for retired meters in a regulatory asset.

(iv) A discussion of what AMI services or functions are currently being utilized, as well as any plans for implementing other AMI services or functions within the next two years.

There are no significant revisions to the AMI services or functions utilized or planned by DEC since the 2016 SGTP.

### **Appendix A – Proposed Changes to Data Access Rules**

Pursuant to the North Carolina Utilities Commission's March 29, 2017 Order Accepting Smart Grid Technology Plans (March 29, 2017 SGTP Order) in Docket No. E-100, Sub 147, requesting that the electric utilities, the Public Staff, and all interested parties continue discussing potential rule changes related to customer data access, and that Duke include a report on those discussions in its 2017 SGTPs, DEC and DEP provide the following report:

Since the issuance of the Commission's March 29, 2017 SGTP Order, DEC and DEP have not had any formal discussions with NCSEA and the Public Staff regarding potential rule changes to address data access issues. During 2017, DEC and DEP had some discussions related to data access issues with NCSEA and the Public Staff in the context of a legislative stakeholder process, but no such legislation was ultimately enacted. The Companies remain willing to have further discussions should the Commission decide to engage in such rulemaking.

# Appendix B – Responses to Questions in Commission's August 23, 2013 Order in Docket No. E-100, Sub 137

Pursuant to the North Carolina Utilities Commission's March 29, 2017 Order Accepting Smart Grid Technology Plans in Docket No. E-100, Sub 147, that DEC and DEP "update their responses to the questions posed in the Commission's August 23, 2013 Order and include those responses in future SGTP filings." Duke Energy Carolinas provides the following response.

The Company has had no significant revisions to the responses provided in the 2016 Smart Grid Technology Plan, Appendix B.

# AMI Program Benefit Details

	Benefit	Benefit Type	Description	Input	Total Savings (20 Years)
1	Eliminate regular meter reads	Expense Reduction	Reduced Meter Reading needs. Benefit derived from current budget, however Metering expects costs/meter for existing contract service to increase by 25% as volume decreases. Decrease budget amount to \$20M.		\$ 48,292,272
2	Reduce off-cycle meter reads and field disconnects/reconnects (COW)	Expense Reduction	Reduced consumer order field visits for Disconnect/Reconnect and Succession reads as these tasks are automated. Reviewed with Fred Logan, Michael Volrich, financial folks. Does not factor in new non-AMI work or final 'geographical coverage' practicality review.	<ul> <li>Utilize 9/15 previous 12 months costs for the following items</li> <li>42% of Cred On/DNP expenses and 100% of OT expense</li> <li>90% of Connect/Disconnect expenses</li> <li>90% of Succession read expenses</li> </ul>	\$ 175,497,020
3	Meter Operations Savings	Expense Reduction	Reduced meter operations costs - field metering labor		\$ 11,049,418
4	Outage – reduce "OK on arrival"	Avoided Costs - O&M	Reduced truck rolls required to verify voltage to meter due to ability to remotely verify. Not currently vetted with business to actually reduce outage assessment budget	Utilize four year monthly average from DOMS of "Ok on arrival" trouble orders related to single calls and mid-level storms, calculation assumed 80% reduced and ¾ hour time	\$ 10,682,427
5	Outage – reduce major storm restoration		Reduced truck rolls required to verify voltage to meter due to ability to remotely verify. Not currently vetted with business to actually reduce outage assessment budget	Utilize three year average of major storm related labor (internal and contract) to determine daily average for major storm restoration. Reduction = ½ day	\$ 25,434,351
6	Miscellaneous O&M costs	Avoided Costs - O&M		<ul> <li>Includes nominal amounts to represent other enabling benefits such as :</li> <li>Improve vegetation management (voltage sag data from meters)</li> <li>Reduced customer calls</li> <li>Reduced estimated bills</li> </ul>	\$ 38,151,526
7	Legacy meter failures	Avoided Costs - Capital		Utilize internal annual failure rate of 1.83% and meter costs of \$61.62 (\$29.62 for material and \$32 for installation)	\$ 49,980,391
8	Miscellaneous capital costs	Avoided Costs - Capital	Basis - estimate	<ul> <li>Includes nominal amounts to represent other enabling benefits such as:</li> <li>Improve asset management (aggregate meter data to identify over/under loaded distribution transformers, and stress points in the grid)</li> <li>Leverage meter Volt/Var data to improve placement of capacitor banks</li> </ul>	\$ 12,717,175
9	Reduce non-technical distribution losses		Assume this includes all revenue capture – including registration erosion, mis- wiring, etc Calculated at 2% of gross Res/Comm revenue, 80% enabled by AMI, 60% billable/recoverable	<ul> <li>EPRI Study - December 2008 - "AMI Technology: Limiting Non-Technical Distribution Losses in the Future"</li> <li>Non-performing/under-performing meters</li> <li>Incorrect application of multiplying factors</li> <li>Defects in CT &amp; PT circuitry</li> <li>Non-reading of meters</li> <li>Pilferage by manipulating or bypassing of meters</li> <li>Theft by direct tapping</li> </ul>	\$ 634,863,861

Appendix C – DEP AMI Analysis Files	21

### Overview

As required by the North Carolina Utilities Commission (NCUC or Commission) Rule R8-60.1(b), Duke Energy Progress (DEP or Company) submits its 2017 Smart Grid Technology Plan Update (SGTP Update). The 2017 SGTP Update represents the significant amendments or revisions to the 2016 Smart Grid Technology Plan.

### 1. Smart Grid Technology Strategy

Reference	Requirement
R8-60.1(c)(1)	A summary of the utility's strategy for evaluating and developing smart grid technologies.

#### **Power/Forward Carolinas Grid Improvement Plan**

Announced in 2017, the Company outlined its plans over the next decade to modernize the North Carolina grid. Power/Forward Carolinas is comprised of strategic programs that will each play a part in building a smarter energy future for customers. These strategic programs represent the means to deliver the Road Ahead strategies of modernizing the power grid and transforming the customer experience, as outlined in the 2016 SGTP. The early years of Power/Forward Carolinas will establish the foundational and enabling infrastructure and technologies to achieve the Company's long-term objectives of a more reliable, resilient grid to better serve customers.

Certain programs included in the Power/Forward Carolinas initiative are technologies that fall under the definition of "smart grid technologies" outlined in Commission Rule R8-60.1(c), while others are not. All of the programs have similar objectives in the long term, improving reliability and resiliency of the grid; however, certain programs, like Targeted Undergrounding, are not deemed smart grid technologies. The Company has determined that the Self-Optimizing Grid, and certain portions of the Enterprise Systems Upgrades, Communications Network Upgrades and Transmission Improvements programs, meet the criteria for the SGTP and will be outlined within the Plans each year as applicable. The Enterprise Systems Upgrades primarily consists of the Distribution Management System (DMS) Consolidation projects as outlined in the 2016 SGTP. Applicable projects or initiatives are included in the 2017 SGTP Update, or will be included in future SGTPs as appropriate.

These strategic programs may be comprised of multiple gated projects and annuallyfunded work streams to accomplish the end state objectives. Each year, the Company funds and prioritizes the work efforts through the annual budgeting process, and the following governing bodies provide oversight of the portfolio: management teams, steering teams, and the financial management committee.

Cross-functional management teams aligned around the strategic programs provide program and project governance, gating and change request oversight. The management teams are also responsible for deployment performance, business readiness, issue resolution, and benefit tracking and reporting. Steering teams provide strategic oversight of all programs and projects to ensure alignment with enterprise, regulatory, financial, customer and operational strategies. Steering teams are responsible for portfolio performance, alignment with the grid improvement plan, cross-functional issue resolution (if escalated from the management teams) and to review and approve significant changes in the overall strategy. Finally, the financial management committee tracks the expenditures of the organizational budgets set forth by the Company. The committee also manages the reallocation of funding within the programs and projects to maintain budgetary compliance and determines available funding for emergent work, change requests, or any other item that has a financial impact to the organization.

The initial planning for the 10-year Grid Improvement Plan was completed in early 2017. Given this is a 10-year plan, the company will utilize a "progressive elaboration" process, pursuant to Project Management Institute best practices, to govern the plan throughout the lifecycle. In this process, the initial overall 10-year plan concepts are approved first, then a more detailed version of each year's plan is submitted and approved annually.

#### **Stakeholder Outreach**

#### **Collaborative Initiatives**

Through the North Carolina Public Benefits Funds, administered by Advanced Energy and Duke Energy, along with generous technical support from North Carolina's Electric Membership Cooperatives, Duke Energy and Dominion Energy North Carolina, there have been several smart grid stakeholder education initiatives.

As described in the 2016 Smart Grid Technology Plan, Advanced Energy's outreach efforts are being designed to help our state's residents make well-informed energy decisions. They want to share information about new technologies and services when they believe they can offer value, and they also want to share any concerns that may present risk. Highlights of the accomplishments over the past year include:

• Hosted a facilitated cross-sector planning meeting in November 2016 to identify priority audiences and energy related topics to focus educational and outreach efforts for 2017.

The key audiences identified by the stakeholders were: state legislators, utilities commissioners, county commissioners, municipal staff, public staff and large business customers.

- Identified a webinar series as the most efficient and flexible delivery method for the outreach and education body of work for the priority NC stakeholder audiences identified.
- The overarching goal of the webinar series was to build awareness among the targeted key decision makers on relevant smart grid topics and their effects on technology, economic development, and policy across North Carolina.

2017 NC Smart Grid Webinar Series

- 1. Smart Grid Basics (presented April 26, 2017)
- 2. Solar Power and Grid Integration (presented May 24, 2017)
- 3. Smart Meters and Advanced Metering Infrastructure (presented June 22, 2017)
- 4. Microgrids and Grid Resiliency (presented September 20, 2017)
- 5. Self-Optimizing Grid (scheduled October 24, 2017)
- Created a publicly accessible website, <u>www.NCSmartGrid.org</u>, hosted and maintained by Advanced Energy. This site contains a repository of smart grid resources, presentation collateral and video links that can be used by stakeholders state-wide. Recordings of the NC Smart Grid Webinar Series are available through the NC Smart Grid website as an ongoing resource for stakeholders.
- Future engagement activities include plans to convene a facilitated stakeholder session in November 2017, similar to that which took place in November 2016, to gather scoping input for 2018 education and outreach work.

# 2. Improving Reliability and Security of the Grid

Reference	Requirement
<i>R8-60.1(c)(2)</i>	A description of how the proposed smart grid technology plan will improve reliability and
	security of the grid.

The description for each new technology project listed under Sections 3 through 5 and the specific benefits described, outline the impacts each project will have on the reliability and security of the grid. Additionally, the grid improvement plan as a whole will provide synergies resulting in greater overall value in improving grid security, reliability and resiliency, while also creating greater efficiencies and improving safety and sustainability.

One of the primary objectives of the Power/Forward Carolinas grid improvement plan is to reduce outages. When outages do occur, the goal is to reduce the time customers are without power. There are additional objectives that will address the physical and cyber security of the grid through specific programs, and also as an ancillary result of other programs. While some of these programs may not fall into the definition of smart grid technologies, all are designed to play a vital role in modernizing the grid.

## 3. Current and Scheduled Technology Deployments

Reference	Requirement
R8-60.1(c)(3)	For all smart grid technologies currently being deployed or scheduled for implementation within the next five years: $(i) - (vii)$

### **DEP AMI Deployment**

(i) A description of the technologies, including the goals and objectives of each technology, options for ensuring interoperability of the technology with the legacy system, and the expected life of the technology.

AMI is the foundational investment that will enable enhanced customer solutions - giving customers greater control, convenience and choice over their energy usage, while also giving customers the opportunity to budget, save time and save money. AMI technology allows a utility to gather more granular usage data and utilize new capabilities to offer new programs and services to customers that are not achievable through existing meters. The AMI technology will pave the way for programs that will allow customers to stay better informed during outages, control their payment due dates, avoid deposits, to be reconnected faster, and to better understand and take control of their energy usage, and ultimately, their bills. Over time, the Company also expects AMI meters to contribute to cost reductions from reduced truck rolls in the years after deployments.

Deployment of AMI meters allows customers to start, stop and move service without the need for a technician visit. The AMI meters also provide an interface for customers to see and understand their hourly energy usage, allowing them to better manage their consumption and, as a result, their bills. AMI meters will enable future customer programs such as outage notification alerts, mid-billing cycle usage alerts, a real-time usage application for smart phones, and the ability for customers to select their payment due date. The technology can also enable future energy efficiency options and potential time-of-use rate offerings as well as pre-payment programs. Current meters cannot provide these capabilities.

The proposed AMI meters are directly interoperable with the existing enterprise AMI meter systems and have a planned life of approximately 15 years.

(ii) The status and timeframe for completion.

The Board of Directors has endorsed the DEP AMI deployment project; however, the outcome of regulatory considerations in the DEP rate case could affect the Company's timing to advance the project.

(iii) A description of any existing equipment to be rendered obsolete by the new technology, its anticipated book value at time of retirement, alternative uses of the existing equipment, and the expected salvage value of the existing equipment.

The existing DEP meters that are in scope to be replaced by the AMI deployment, along with the associated communications equipment, had a net book value of approximately \$89.6 M as of December 31, 2016, which is expected to be approximately \$77.2 M on December 31, 2017.

(iv) A description of how the utility intends the technology to transfer information between it and the customer while maintaining the security of that information.

AMI meters capture energy usage and send it to grid routers directly, through range extenders, or through other meters to form a radio frequency (RF) mesh network. The grid routers transmit collected usage data to the AMI headend system via cellular backhaul once each day. The head-end system acts as the data collection point inbound from the metering infrastructure, as well as providing meter command and encryption key management outbound. The data is then sent to a Meter Data Management (MDM) system which provides billing determinants to the customer billing system for billing.

The data collected by the AMI meter utilizes a unique meter number (not displayed on the meter face) and thereby contains no personally identifiable customer information. All data is encrypted at the meter and decrypted at head-end system. The meter number is then used as the linkage to other information within the customer billing systems.

See additional information covered in Section 7(iv) and Appendix B related to how the utility provides usage information to customers through the secure online customer portal and billing statements.

(v) A description of how third parties will implement or utilize any portion of the technology, including transfers of customer-specific information from the utility to third parties, and how customers will authorize that information for release by the utility to third parties.

This section is not applicable as this project does not currently involve the transfer of customer information to any third-parties. Refer to Appendix B for general information on providing data to customers and third parties.

(vi) Approximate timing and amount of capital expenditures, including those already incurred.

DEP has incurred approximately \$196,000 of actual capital expenditures on the AMI project through July 2017 for planning efforts. Based on the most recent cost estimate for the project, the forecast capital costs are outlined below:

ise		
gy		
ith		

DEP AMI Capital Forecast	2017	2018	2019	2020	2021
Annual Capital \$ (millions)	\$4.6	\$72.5	\$98.4	\$93.6	\$8.9

(vii) Analyses relied upon by the utility for installations, including an explanation of the methodology and inputs used to perform the analyses.

The analysis attached in Appendix C was presented to Company Management and Board for consideration of the project. This analysis represents total capital and operating expense deployment costs and operational benefits over a 20-year period, for the entire Duke Energy Progress service territory (North and South Carolina).

Additionally, part of the Company's strategy moving forward has been aligned with providing customers with more choice, convenience and control. Therefore, the ability to offer the enhanced customer services and programs as detailed in section R8-60.1(c)(3)(i) above, along with improvements in customer satisfaction, are some of the non-quantifiable benefits further supporting the Company's decision to move forward with a full AMI deployment.

For the analysis and supporting files, see Appendix C. Exhibit A DEP AMI Deployment Analysis outlines the project and analysis. For a summary of the costs see Exhibit B CONFIDENTIAL DEP AMI Cost Estimate Summary. For a summary of the benefits see Exhibit C DEP AMI Benefits Summary.

For the additional cost details, see **Exhibit D DEP AMI Cost Description Detail** and **Exhibit E CONFIDENTIAL DEP AMR to AMI Deployment Class 2 Final**. For additional benefit details, see **Exhibit F DEP AMI Benefit Details** and **Exhibit G CONFIDENTIAL DEP AMI Benefits Calculations and Assumptions Final**.

#### **Self-Optimizing Grid**

(*i*) A description of the technologies, including the goals and objectives of each technology, options for ensuring interoperability of the technology with the legacy system, and the expected life of the technology.

The Self-Optimizing Grid (SOG) Program implements additional design criteria on distribution circuits that improves reliability and enhances system resiliency. This resiliency will enable the system to reduce outage duration from fault events. Key components of the projects will involve adding capacity to distribution circuits and substation transformers and connecting radial distribution circuits together with automated switches. The head-end enterprise systems such as the Self-Healing software and the Distribution Management System (DMS) software are essential to enabling this capability.

The Self-Optimizing Grid is an advancement from Self-Healing "Networks". The Self-Healing Networks and Feeder Segmentation projects were a foundational step in the progression towards the SOG program. Instead of having individual circuit pairs that can back each other up, the integrated grid network allows for multiple circuit rerouting options to re-energize segments and minimize customer outage events. The SOG program will further segment the circuits to minimize the number of customers affected by sustained outages and ensures the necessary capacity and connectivity to fully leverage the segmentation.

Under this program, circuits will have automated switches deployed according to the SOG guidelines, which outline automated switches approximately every 400 customers, or 3 miles in circuit segment length, or 2 MW peak load. The goal of the SOG program is to have 80% of customers served from circuits that have alternate power re-routing options and sufficient capacity to re-route power without being overloaded the majority of the time. Circuits that meet these additional guidelines will have SOG capabilities.

The SOG will automatically reroute power around a problem area, like an outage caused by a tree falling across a line, animal interference, or fault events. With this automation, the grid can self-identify problems and isolate affected areas by reconfiguring the circuits, which can shorten or even eliminate outages for many customers.

Automated switch equipment typically has an approximate 20-year expected life, and control and communications equipment, an approximate 5- to 7-year expected life.

#### (ii) The status and timeframe for completion.

The initial engineering, scoping and planning for the SOG program began in 2017 with expectations to begin field work in 2018. The initial planning will address activities in 2018 and the planning for following years will occur as part of the annual planning process. 2018 is the first year of the expected 10-year program to achieve the anticipated goal of 80% of customers being served by the SOG.

(iii) A description of any existing equipment to be rendered obsolete by the new technology, its anticipated book value at time of retirement, alternative uses of the existing equipment, and the expected salvage value of the existing equipment.

During field work, installations will primarily consist of new equipment to achieve the new SOG guidelines. However, there will be instances where aged, automated switches, or other non-automated equipment will need to be replaced.

(*iv*) A description of how the utility intends the technology to transfer information between it and the customer while maintaining the security of that information.

This section is not applicable as this technology does not transfer information to/from customers.

(v) A description of how third parties will implement or utilize any portion of the technology, including transfers of customer-specific information from the utility to third parties, and how customers will authorize that information for release by the utility to third parties.

This section is not applicable as this technology does not transfer information to/from customers and will not be utilized by third-parties.

(vi) Approximate timing and amount of capital expenditures, including those already incurred.

Estimated costs through end of year 2017 are forecast to be approximately \$0.42 M for planning, scope identification and engineering. Forecast capital expenditures for the next five years are as follows:

<b>DEP</b> (Millions)	2018	2019	2020	2021	2022
Self-Optimizing Grid	\$16.0	\$80.7	\$79.3	\$83.5	\$81.5

(vii) Analyses relied upon by the utility for installations, including an explanation of the methodology and inputs used to perform the analyses.

Self-Optimizing Grid analysis uses the design criteria of segmenting the circuits for approximately 400 customers, 3 miles of circuit, or 2MW of load. Benefits can include:

- Reduces system-wide customers interrupted (CI) and customer minutes of interruption (CMI)
- Creates a networked energy system that improves operational situational awareness
- Minimizes the number of customers impacted by an outage
- Isolates problem areas for quicker mobilization and repair
- Shortens outage duration for impacted customers
- Automates system reconfigurations reducing the need for manual switching
- Improves grid resiliency and ability to recover from major events
- Enables the grid to effectively manage private distributed energy resources

### 4. Technologies Actively Under Consideration

Reference	Requirement
R8-60.1 (c) 4	For all smart grid technologies actively under consideration for implementation within the next
	five years, the smart grid technology plan shall include a description of the technologies,
	including the goals and objectives of the technologies, as well as a descriptive summary of any
	completed analysis used by the utility in assessing the smart grid technology.

#### **Capacitor Bank Controls Upgrade**

Duke Energy Progress has been utilizing the current capacitor bank controls for 15+ years and has nearly 3,000 units in-service today. These devices have been integral in managing the system's reactive power flow during that time. This capability allows the Company to reduce system losses and improve the real power flow capacity on its distribution and transmission system. The implementation of the Distribution System Demand Response (DSDR) program further enhanced the VAR management capabilities of the capacitor bank controls to allow for two-way communications, increased troubleshooting capabilities and automated control of the voltage and reactive power of the distribution system.

Due to the age of the devices, and a recent decision to upgrade the Distribution Management System (DMS) and Distribution Supervisory Control and Data Acquisition (DSCADA) systems, the current capacitor bank controls can no longer provide the needed support due to dated communications and security protocols of the product. Technology enhancements have deemed these products obsolete and incapable for integration into newly designed control systems.

The objective of this program is to systematically replace the obsolete capacitor bank controls with a new version of the equipment and to successfully reintegrate them into the new DMS allowing for continued capabilities of the DSDR program, as well as upgrade the hardware to meet security requirements for smart grid devices.

Benefits of this uplift effort include:

- Integrated process for implementing EM1, EM2 and DSDR capabilities
- Fully integrated security features which include door alarms allowing for increased security from physical intrusion of unauthorized parties
- Integrated Volt/VAR support allowing Company to maintain voltage support
- Reduced programming support needed to integrate two products into new DMS
- Reduced maintenance efforts needed for aged fleet of controls
- Fully enabled remote access allowing for easy updates of firmware and software enhancements

#### **Enterprise Transmission Health & Risk Management Project**

Duke Energy's Transmission Operations manages over 32,200 miles of transmission lines, nearly 10,000 transformers, and nearly 15,000 circuit breakers. As the result of modernization and record keeping over many years, the Company has access to a significant amount of data, and has begun accelerated strategies to employ data analytics to assess the health and risk of failure of the equipment. This method will optimize the utilization of these assets in order to better monitor the operational and financial health of the equipment fleet. However, in the current environment the evaluation of the fleet cannot be performed in a comprehensive manner. The Transmission Asset Management organization is using antiquated tools and manual methods to understand equipment health and to predict and react to equipment failures.

Transmission Health and Risk Management (HRM) is a philosophy for how to manage assets. This philosophy is supported by software, monitoring, data, analytics, data science and people. This project will implement a new enterprise HRM platform to collect and analyze data to prescribe how Transmission can improve the management of its assets. The Company's strategy identifies condition monitoring as a key strategic program and this work aligns with the Road Ahead strategy of modernizing the power grid.

The selected HRM solution is an advanced analytics software package that helps utilities use a systematic, data-driven approach to assess the on-going health of assets, and take specific actions to improve overall system reliability. This enterprise project is estimated at approximately \$40 million and expected to be implemented over a four-year period, beginning by the end of 2017.

The HRM solution enables personnel to better manage Transmission transformer and breaker health, and capture significant value by:

- Reducing operating expenses by prioritizing replacement and maintenance actions
- Improving capital expense efficiency by prioritizing replacement and maintenance actions
- Improving customer value though improved reliability
- Reducing the likelihood of catastrophic transformer failures

**HRM** Project Objectives

- Implement a new HRM platform
- Develop new HRM processes
- Become proactive versus reactive by shifting from an alarming model to a predictive model that incorporates the component, asset, fleet, and system health & risk data
- Extend the lifecycle of aging assets
- Reduce asset failures or catastrophic failures

# Western Carolinas Energy Storage Analysis and Deployment Plan

As stated in DEP's Western Carolinas Modernization Project (WCMP) Annual Progress Report (Docket No. E-2, Sub 1089), DEP has identified multiple opportunities to deploy energy storage in the form of batteries throughout the region, specifically to meet the Commission's order to deploy at least 5 MW of energy storage in the DEP-West region and support the avoidance or deferral of the contingent natural gas-fired Combustion Turbine. Two initial projects, which combine for over 5 MW of capacity, have been submitted to the DEP interconnection queue and are intended to provide essential reliability services, such as frequency, voltage, and ramping support, to the electric grid and capacity during system peaks as well as disconnecting ("islanding") from the grid to mitigate outages for DEP customers connected to certain feeders.

DEP continues to perform due diligence in order to de-risk and develop the initial projects, including environmental assessments, permitting, and technology selection and plans to connect each facility directly to the grid (in front of the meter) at the appropriate distribution voltage and interconnection points. The deployment of these projects will be the first of its kind in North Carolina where a major utility will own batteries to store and dispatch levels of energy significant enough to be used to adequately and reliably serve the electric system and the Company's customers.

These projects represent an opportunity for DEP to procure, install and monitor distributed energy technologies that will allow DEP to provide a smart, safe, cost-effective and reliable solution for serving customers in lieu of performing costly upgrades to and ongoing maintenance of conventional distribution facilities, such as new feeders and substation equipment, in extremely remote and land-constrained regions in Western North Carolina. Additional details regarding the two initial projects and the multi-year storage deployment plan will be provided in the next WCMP Annual Progress Report due in March of 2018.

#### **Enterprise Communications Network Upgrades Program**

#### Strategic Fiber and Wireless Transport

The backbone of Duke Energy's communications network (a.k.a. the 3rd Grid) is the transport network, which consists of fiber optical cable and microwave systems. A recent current state assessment identified 1,750 miles of fiber optic cable that needs to be evaluated for replacement (based on age) and several key fiber rings that are underperforming. Additionally, to satisfy business needs identified during the Enterprise Communications Strategy effort, Duke

Energy will expand its fiber network to connect key generating plants, operations centers, substations and other critical facilities. Microwave systems are also used to provide high capacity connectivity. Many of Duke Energy's microwave systems in place today use network technology that is becoming obsolete, and the capacity of many microwave paths is not meeting business needs.

The Strategic Fiber and Wireless Transport work stream will begin replacing end-of-life fiber optic cable and microwave systems, add fiber to new, targeted routes based on business needs, and investigate alternatives to optical ground wire to enable Duke Energy to deploy fiber faster and less costly. The Enterprise Communications strategy concluded that to move to a smarter grid, the Company needed to:

- Treat communications as the 3rd Grid (e.g., an enterprise asset) and elevate communications to the same status as the electric grid and the gas grid
- Implement Broadband Internet Protocol from the core to the edge of the grid
- Make communications grid improvements that ensure: resiliency, reliability, security, capacity, and low latency. Fiber is one of the primary ways to enhance the entire communications grid.
- Expand network infrastructure, uplifting end-of-life technology and implementing a holistic network design

#### Grid Wide Area Network (WAN)

The Grid WAN initiative includes efforts to replace end-of-life data network hardware on the network core and in substations, and to convert substation hardware to Internet Protocol (IP). This work stream also includes redesigning existing networks for more capacity and better resiliency, and developing strategies for the Field Area Network (FAN) and Neighborhood Area Network (NAN).

A FAN strategy is being developed to support changes to grid communications due to the emergence of solar and battery storage, microgrids and distributed intelligence. A NAN strategy will also help to optimize the value of the AMI infrastructure by enabling other use cases such as lighting controls and demand response to benefit from its two-way mesh communications, in addition to scaling it for enterprise-wide AMI.

#### Next Generation Cellular

Duke Energy primarily uses a cellular vendor for cellular connections to substations, distribution line devices, AMI backhaul devices, direct-connect meters and load management

switches. A significant number of these modems use 2G/3G technology which will be decommissioned by the cellular vendor by the end of 2022. Therefore, the Company will need to replace its 2G/3G cellular modems by the end of 2022. Some of these modems may be replaced by other efforts, such as the enterprise roll-out of AMI and the replacement of end-of-life substation routers; however, any remaining modems will be replaced as part of this work stream.

### 5. Technology Pilots and Initiatives

Reference	Requirement
R8-60.1 (c) 5	For each pilot project or initiative currently underway or planned within the next two years to
	evaluate smart grid technologies: $(i) - (v)$

At this time, the Company does not have any new pilot projects or initiatives to evaluate smart grid technologies.

# 6. Projects No Longer Being Considered

Reference	Requirement
R8-60.1 (c) 6	A description of each project or initiative described in a previous plan that is no longer under consideration by the utility, and the basis for the decision to end consideration of each project
	or initiative.

At this time, the Company does not have any projects or initiatives that are no longer under consideration.

# 7. Advanced Metering Infrastructure (AMI) Summary

Reference	Requirement
R8-60.1 (c) 7	For automated metering infrastructure (AMI), in addition to the information required in
	subsections (3) or (4) of this section, as appropriate, the utility shall also provide: $(i) - (iv)$

(i) A table indicating the extent to which AMI meters have been installed in the utility's service territory and specifically in North Carolina, the North Carolina jurisdictional customer classes and/or tariffs of customers with AMI, and the predicted lifespans of these installations. This table should indicate the number of AMI meters that has been installed both cumulatively and since the filing of the last smart grid technology plan.
(ii) The number of meters in North Carolina that use traditional metering technology and/or automated meter reading (AMR) technology, and the predicted lifespans for these installations.

Customer Class	AMI Meters	AMR Meters	Walk-By & Other Meters
NC Residential	20,422	1,158,462	5,909
NC Commercial	35,099	155,079	18,293
NC Industrial	1,296	651	2,658
NC Company	2	437	0
Use & Other			
Totals	56,819	1,314,629	26,860

#### Meters installed in DEP North Carolina as of August 2017

DEP has installed approximately 182 AMI meters since the information provided in the 2016 Smart Grid Technology Plan. The predicted lifespan of the AMI meters is approximately 15 years, and all other meters currently installed have a predicted lifespan of 15-20 year.

(iii) Any adjustment made by the utility to its capital accounting due to AMI, including the dollar amount of writedowns of its meter inventories.

As of the time of this filing, the Company has not made any capital accounting adjustments due to AMI. DEP is awaiting Commission approval in Docket No. E-2, Sub 1142 for the Company's request to include the amount for retired meters in a regulatory asset.

(iv) A discussion of what AMI services or functions are currently being utilized, as well as any plans for implementing other AMI services or functions within the next two years.

At this time, the primary AMI functionality being utilized is the remote meter reading capability.

Once the proposed AMI deployment project is complete, along with the remote meter reading, the AMI meters will also provide enhanced detection of meter tampering. DEP plans to utilize the remote order fulfillment capabilities of the meters, allowing for remote off-cycle reads

or re-reads, remote reconnections and disconnections, and read-in/read-out orders to stop or start service.

Additionally, DEP also plans to provide the ability to access day prior electric usage information via the internet-based Customer Portal. The Portal will display usage information up to and including prior day usage. Customers will be able to view daily and average energy usage by billing cycle or month. Customers will also be able to view average energy usage by day-of-week, and hourly energy usage by day or week. Time-of-Use and Demand customers are able to view the information above, and can also see the date and hour when the peak usage or peak demand occurred, for the current or selected billing cycle. Customers will have the ability to download their hourly usage data from the Customer Portal in a .CSV format.

### **Appendix A – Proposed Changes to Data Access Rules**

Pursuant to the North Carolina Utilities Commission's March 29, 2017 Order Accepting Smart Grid Technology Plans (March 29, 2017 SGTP Order) in Docket No. E-100, Sub 147, requesting that the electric utilities, the Public Staff, and all interested parties continue discussing potential rule changes related to customer data access, and that Duke include a report on those discussions in its 2017 SGTPs, DEC and DEP provide the following report:

Since the issuance of the Commission's March 29, 2017 SGTP Order, DEC and DEP have not had any formal discussions with NCSEA and the Public Staff regarding potential rule changes to address data access issues. During 2017, DEC and DEP had some discussions related to data access issues with NCSEA and the Public Staff in the context of a legislative stakeholder process, but no such legislation was ultimately enacted. The Companies remain willing to have further discussions should the Commission decide to engage in such rulemaking.

# Appendix B – Responses to Questions in Commission's August 23, 2013 Order in Docket No. E-100, Sub 137

Pursuant to the North Carolina Utilities Commission's March 29, 2017 Order Accepting Smart Grid Technology Plans in Docket No. E-100, Sub 147, that DEC and DEP "update their responses to the questions posed in the Commission's August 23, 2013 Order and include those responses in future SGTP filings," Duke Energy Progress provides the following response:

The Company has had no significant revisions to the responses provided in the 2016 Smart Grid Technology Plan, Appendix B.

Appendix C – DEP AMI Analysis Files

# **DEP AMI Deployment Analysis**

#### **Executive Summary**

The DEP AMI Deployment project is an effort to fully deploy Advanced Metering Infrastructure (AMI) across the Duke Energy Progress service territory. The deployment, planned to begin in Q1 2018, will include field installations of metering and communication equipment, as well as field and back office efforts to optimize the AMI network. By leveraging deployment experience and pre-established vendor relationships from AMI deployments in other Duke Energy jurisdictions, this project is expected to complete the meter replacements in less than three years. The deployment will utilize the Enterprise solution for AMI–Itron OpenWay. Over 1.5 million Itron OpenWay AMI meters have been installed to date, with full deployments underway in Duke Energy Carolinas and Duke Energy Indiana.

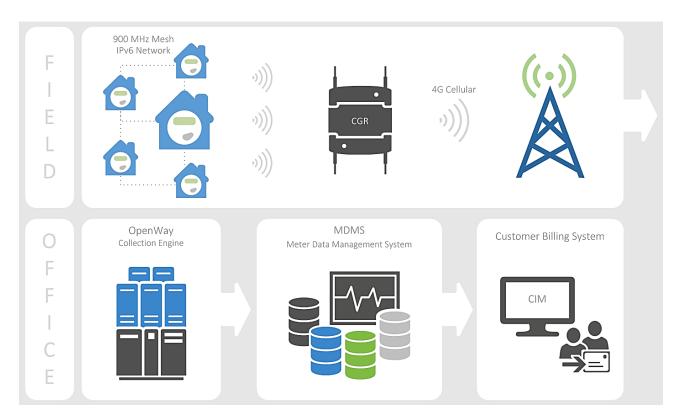

The DEP AMI Deployment will enable the company to leverage AMI for significant customer and operational benefits. The complete AMI architecture is foundational to providing the Enhanced Customer Solutions (ECS) designed to offer increased control, convenience, choice, and transparency. These Enhanced Customer Solutions, which include offerings such as remote connect/disconnect, usage alerts, customer usage mobile application, outage and voltage alerts, Prepaid Advantage, and choose your own due date, are key to improving customer satisfaction (See Appendix 1). Operational benefits include significantly reducing field trips for meter reading, reconnecting power, and disconnecting power. In addition, advanced metering provides frequent and robust data enabling the company to more accurately detect revenue loss, bolster grid telemetry, monitor voltage quality, and improve outage management.

The net book value of the metering assets to be replaced in DEP as part of this project was approximately \$89.6MM as of December 2016, and is expected to be approximately \$77.2MM at year-end 2017.

#### **Project Description**

### **System Description**

#### **Strategic Rationale**

Advanced metering has proven its value to both customers and the business in strategic predecessor projects throughout the Enterprise. Installation of AMI in the DEP service territory will enable the most cost-effective operational processes for metering and is a foundational step to provide a suite of services that have become standard in business and the electric utility industry. As Duke Energy customers increasingly demand these services and the pressures on the Company to reduce operational costs grow stronger, it is critical to accelerate the deployment of AMI.

#### Background

There are currently 1.565 million meters in the Duke Energy Progress service territory, the majority of which are read monthly by the mobile meter reading system. In addition, a small number (65K) of Silver Springs Network (SSN) AMI meters were installed from 2012-2013, replacing walk-by meters as part of a DOE grant. SSN is a hosted AMI solution, which does not support enhanced customer offerings and results in high on-going maintenance fees.

This project will replace both the mobile and SSN metering solutions in DEP with Itron OpenWay AMI Duke Energy S Enterprise AMI solution. Itron offers a cost-effective technology that will provide significant reductions in operating cost and increased functionality. This technology also fully aligns with and enables the full suite of Enhanced Customer Solutions. With the Itron AMI solution, customers will benefit Oct 02 2017

2

Appendix C

from the ability to participate in all future offerings, such as timely outage notifications and increased transparency into their energy usage.

#### Scope

•

This effort will fully deploy Itron OpenWay AMI technology across the Duke Energy Progress service territory. The project has been broken down into the following areas:

Advanced Metering Infrastructure Pre-Scale Deployment

 Perform vendor and technology pilot to ensure end-to-end system functions properly and there is no impact to customer billing by deploying 100 meters and required communication infrastructure
 Q4 2017 - Q1 2018

Advanced Metering Infrastructure Deployment

- Deploy ~1.56M Itron OpenWay AMI electric meters
  - o Q1 2018 Q4 2020
- Install and optimize the Itron AMI network, leveraging Cisco IPv6 technology
  - o Q1 2018 Q2 2021

#### Contractor/Vendor/Technology Selection

#### Meter Installation Contractors:

Duke Energy currently has Master Service Agreements with four meter installation vendors, of which three are currently installing AMI in Duke Energy jurisdictions. For the DEP AMI Deployment, Duke Energy will include these four vendors in the bid process and consider additional vendors due to the amount of work across all AMI vendors during the deployment period. The DEP AMI Deployment will likely leverage three vendors to complete the deployment. Utilizing multiple vendors will minimize the risk of non-performance from a single vendor and shift volume in a way that improves productivity and efficiency. In addition, the multiple installation vendor approach will help reduce risk of a single vendor not meeting the scheduled deployment timeline.

The three vendors currently installing at Duke Energy as part of the DEC and DEI AMI deployments have proven track records. Prior to selection, these vendors were thoroughly vetted, including verifying references, financial screenings, and a completed scoring matrix (Commercial & Technical).

#### Meter Manufacturer:

Itron will be the technology vendor of the OpenWay AMI solution. Itron was selected as part of a rigorous RFQ process completed in 2014. During this process, a number of prequalified industry leaders in AMI were solicited, four of which responded. The vendors were subsequently scored by multifunctional teams in both commercial and technical areas. Each team used a standardized approach to weigh key attributes within its focus areas, ensuring each vendor was fairly ranked. At the completion of this exercise, the Itron OpenWay solution was identified as the leader and was awarded the RFQ. This technology is being leveraged moving forward with all future AMI deployments. Also, Itron will manufacture the meters and communication devices within the United States, primarily at the plant located in Oconee, South Carolina.

Itron has proven the OpenWay AMI solution at several large utilities, including over 20 major AMI deployments and more than 20 million endpoints deployed. There are currently over 1.5 million total

#### Exhibit A

OpenWay endpoints installed in the Duke Energy Carolinas, Duke Energy Indiana, Duke Energy Ohio, and Duke Energy Kentucky service territories. These deployments leverage several different communication offerings available within the OpenWay platform. The DEP AMI Deployment will take a hybrid approach that will utilize both the Cisco IPv6 mesh and 4G cellular provider networks. Specifically, the project will install the Itron IPv6 electric mesh meter for most applications. In addition to the mesh meter, the 4G LTE cellular meter will be installed in remote, rural, and hard-to-reach locations where the 4G solution is more cost-effective than building out a Cisco IPv6 mesh network. Using this hybrid approach to communications, which has been well-demonstrated in other Duke Energy jurisdictions, will enable more customers to receive the full benefits of AMI.

#### Meter Data Management System (MDMS):

The Enterprise solution for AMI meter data management is the Oracle Meter Data Management System (MDMS). This system provides functionality to collect and validate the accuracy of interval AMI data prior to billing. In addition, the MDMS calculates bill determinants, allowing the billing system to generate customer bills. There are currently over 1.5 million Itron AMI meters being billed through this system. The DEP AMI Deployment project will continue to leverage MDMS to support data collection, billing, and the Enhanced Customer Solutions enabled by AMI technology.

#### Schedule & Milestones

#### **Contractual Structure, Compliance & Legal Discussion**

#### Itron (Meter Manufacturer):

This project will leverage the existing Itron Master Agreement executed in 2012, which includes software, hardware, services, and maintenance. The Master Agreement was amended to reduce overall cost based on the AMI meter volumes approved by the Company in 2016. This will result in significant discounts that apply to all future AMI meter purchases. In addition, the Master Agreement has several unique clauses that provide protection to Duke Energy based on the complexity of the technology. This Master Agreement is being leveraged for all on-going Itron AMI deployments. The term of the contract will run through April 2022.

#### Installation Vendors:

Master Service Agreements have been established with four potential installation vendors. Each of the Master Agreements contains language specific to safety requirements, security, termination for convenience, and an attachment for a third party service provider agreement. The Agreements have

Oct 02 2017

4

Appendix C

been structured such that the vendor will be paid only for installed units; the vendor will not be paid for units that are returned to the utility.

Once the project has received approval, the vendors will be solicited to provide a quote for completing the installation for the DEP AMI Deployment. Taking into consideration the Enterprise-wide installation strategy, along with commercial and technical terms, the project will be awarded to the best evaluated vendors.

#### Communication Device Installations:

The communication equipment will be installed by a combination of Duke Energy staff (as resources are available) and existing Delivery Operations-approved contractors (with existing Master Service Agreements).

#### **Alternative Analysis**

During the Regulated Utility Strategy Development (RUSD) work, a detailed analysis of alternatives capable of providing a basic level of defined customer offerings was conducted. It was determined that the AMI system is the only commercially-available technology capable of providing and supporting these offerings/services. Provision of these services is viewed as critical to the objective of expanding customer offerings that will lead to greater customer satisfaction.

In addition, the analysis evaluated the technology landscape for utility metering. This included hosting multiple roadmap sessions with the technology offices of key meter manufacturing companies and consulting with an EPRI representative. Based on these sessions and additional industry research, it was determined that a potential leap in technology would most likely not occur before 2030, at least not in a commercially viable product ready for utility installation at over 1.5 million delivery points. Therefore, the recommendation was to accelerate the deployment rate of the Itron OpenWay AMI platform, allowing the benefits of AMI to be realized for both customers and the Company, while allowing adequate time to fully recover the AMI system assets. It was concluded that the only present alternative to AMI would be to postpone the deployment until the next generation of technology is available.

#### **Project Costs & Contingency**

The DEP AMI Deployment project team has leveraged significant experience from predecessor AMI deployments in developing the cost estimate. Below is a summary of major cost components.

Materials <sup>1</sup>	\$198,056,885
Project Labor <sup>2</sup>	\$22,687,505
Equipment Installation <sup>2</sup>	\$37,992,150
Labor Escalation	\$1,766,413
Overhead Allocation <sup>3</sup>	\$2,471,519
Estimate Contingency <sup>4</sup>	\$11,517,479
Risk Contingency <sup>4</sup>	\$3,670,524
AFUDC <sup>5</sup>	\$0
Total	\$278,162,475

<sup>1</sup> Material costs were calculated using the contractual pricing that has already been established with the vendor.

<sup>2</sup> Project labor and installation costs are based on experience from past and on-going AMI deployments projects.

<sup>3</sup> Overhead allocations are based on forecasted staffing needs and the total cost of expected projects that these charges would be distributed amongst.

#### Exhibit A

<sup>4</sup> Appropriate contingency for materials and labor is included in the cost estimate to account for estimate uncertainty. In addition to contingency, several risks were identified and monetized. The Expected Monetary Value (EMV) of project risks is included in the estimate and the top risks are detailed in section 4.1. Total contingency (estimate uncertainty and risk EMV) is approximately 5.8%, which is within the PMCoE normal range. The contingency is deemed appropriate based on estimate maturity and firm contract pricing for materials.

<sup>5</sup> There will be no AFUDC, as AMI meters are placed in-service and considered used and useful upon installation.

#### **Total Costs & Benefits**

	Actuals		Year 1		Year 2		Year 3		Year 4		Year 5		Years 6-20	Total

#### **Regulatory Revenue Lag**

(\$ in Millions)	2016	2017	2018	2019	2020	2021
Pro Forma Annual Revenue	-	-	0.6	9.9	22.7	33.8
Annual Revenue Requirement	-	0.6	9.9	22.7	33.8	33.7
Regulatory Revenue Lag	-	(0.6)	(9.3)	(12.8)	(11.1)	0.1

Detailed financial analysis is presented in Appendix 2.

# **Risks & Mitigations**

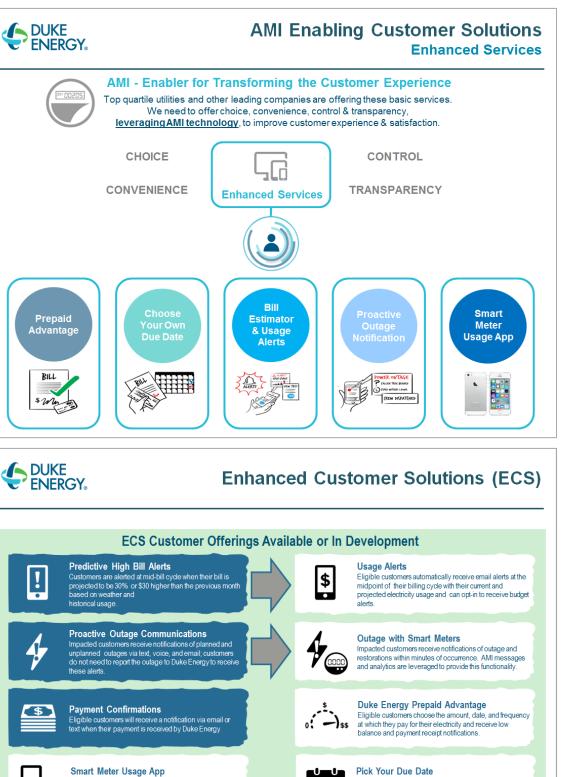

Top Risks	Impact	Discussion & Mitigation
Communications Equipment Requirements Exceed Plan	Financial	If more range extenders and/or CGRs are needed for the mesh network to communicate, then the project <sup>®</sup> s direct materials costs and installation costs will exceed budget. Detailed network design will be obtained prior to deployment. Appropriate contingency
		is included in cost.
Installation Vendor Underbid	Financial	If installation vendor underestimates cost, or costs to support equipment installation increase (e.g. gas prices), then equipment installations costs will exceed budget.
	Tinanciai	Proactive auditing of contractors and Duke resources will be performed over the life of the project.
Installation Vendor Pricing Bid		If the assumption that installation vendor pricing bids will be similar to DEC and DEI RFQ pricing is incorrect, then installation costs may exceed budget.
is not similar to DEC or DEI AMI RFQs	Financial	Estimated installation costs are based on the highest vendor responses to the DEI AMI and DEC AMI RFQ's with an added \$1 per meter and 5% contingency for future rate discussions.
Increase in Required 4G Cellular (Direct Connect)	Financial	If more 4G cellular meters are required due to poor mesh communications, then the project direct materials costs may exceed budget and installation costs may increase due to revisits.
Meters		Detailed design will be obtained prior to deployment. Appropriate contingency is included in cost estimate.
		If one of the installation vendors is unable to adequately staff or meet deployment expectations, then the project deployment schedule could be delayed.
Resource Constraint (Meter Installation Vendors)	Financial	Project plans to utilize proven vendors from predecessor/on-going AMI projects at Duke. Three vendors will be used to mitigate risk of nonperformance from any one vendor. Also plan to include additional vendors under a Master Agreement, in case the need arises to move quickly to another vendor.
Delay in MDM CIM		If the Phase 1 go-live for the MDM-CIM billing integration project is delayed by 30 days or more, then the deployment start date would be delayed.
Delay in MDM-CIM Integration project	Financial	Project will work closely with the MDM-CIM project team to proactively identify any potential delays. Pre-Scale Deployment timeline includes contingency to account for reasonable delays to MDM-CIM go-live.

If chilled mitigation recourses are limited or unavailable, then the people and level			
investigation, data diagnostics, and meter data interpretation necessary to resolve	(Availability of Skilled	Financial	Resource constraint probability is low. Contingency plan includes utilizing Itron

### **Stakeholder Discussion**

Stakeholder	Discussion of Interest & Impact	Assessment
Customers	<ul> <li>Project will bring AMI capabilities to 1.56 million customers in DEP, allowing DEP customers to receive all of the AMI-enabled products and services offerings that will be available in neighboring jurisdictions.</li> <li>The Enhanced Customer Solutions enabled by AMI will improve customer experience and satisfaction by offering increased choice, control, convenience, and transparency.</li> <li>Deployment methodology will leverage experience from predecessor AMI deployments, including approach to customer awareness and deployment information.</li> </ul>	F
Community	<ul> <li>One benefit of AMI is the ability to remotely complete certain routine work such as disconnects, reconnects, and meter reads. This will result in a reduction in the amount of miles driven by the Company, reducing its overall carbon footprint.</li> <li>AMI deployment will enable renewable energy customers to have increased visibility into their energy profile.</li> </ul>	F
Employees	<ul> <li>Project aligns with company!s Road Ahead goals of enhancing operational efficiencies, supporting achievement of the company!s financial objectives through O&amp;M reductions, and improving the lives of our customers through enhanced customer offerings.</li> <li>Impacted employee stakeholder groups have been consulted in development of this effort and will continue to be actively engaged throughout deployment.</li> </ul>	F
Shareholders	• Project will enable enhanced customer offerings with the objective of improving customer satisfaction, reduce operating costs by automating meter reading and enabling remote connects and disconnects, and increase revenue capture by reducing theft, tampering, and equipment failures	F
Regulators	<ul> <li>NC Public Staff and SC Office of Regulatory Staff have expressed interest in the timing of a full roll-out of AMI for DEP. In its March 29, 2017 Order accepting the 2016 SGTPs, the NCUC directed DEP and DEC to provide specific plans on AMI deployments in filed SGTPs prior to beginning deployment.</li> <li>DEP plans to file an AMI opt-out tariff; however, the timing is contingent upon Commission approval of the DEC AMI opt-out tariff.</li> </ul>	Ν
Note: Favorable (F	F); Unfavorable (U); Neutral (N)	

#### Exhibit A

Customers can view, monitor, and engage with their realtime energy usage on their mobile device to make behavioral changes and save energy and money.

Does not require a smart meter

Oct 02 2017

Eligible customers select the billing due date that best aligns with their financial situation and income stream and

which falls within regulatory policy.

#### AMI / Smart Meter Cost Description Definitions

Capital - Program Costs Initial Capital	
Description	Definition
	Material costs of the AMI communication devices, including Cisco Connected Grid Routers (CGRs) and Itron Range Extenders (RE), as well as material adders,
Costs of Communication Equipment	including warehousing, handling, installment consumables (nut, bolts, etc.), and sales and use taxes.
Costs of Meters	Material costs of the OpenWay IPv6 mesh meters and 4G cellular (direct connect) meters, as well as material adders.
Installation Cost & Vendor Services	Equipment installation costs, including Duke (internal) and contractor (external) labor
Project Management Labor	Internal Project Management labor costs to support AMI implementation
Other Labor (Billing, Telecom)	Project labor costs for Billing and Telecom resources
Labor to Optimize Network	Field labor to optimize AMI network throughout implementation
Contingency (Estimated Uncertainty)	Contingency representing uncertainty in estimate components (rates, hours, materials, etc.)
Contingency (Risk)	Contingency representing Expected Monetary Value (EMV) of identified risks
Miscellaneous (Optimization Equipment)	Miscellaneous tools, equipment, and supplies required for the AMI equipment installation and project support (e.g. power cords, brackets, office supplies)
Overhead Allocations	Overhead allocations based on Project Management Organization labor
Labor Escalation	Escalation in labor costs based on DOE Escalation Rates

O&M - Program Costs Non-Recurring O&M	
Description	Definition
Field Tools	Optical probes required for AMI meters
Contingency (Estimated Uncertainty)	Contingency representing uncertainty in estimate components (field tools)

Capital - Recurring Costs	
Description	Definition
	Materials costs associated with communication device failures based on expected failure rates and replacement of equipment at the assets' end of life. Includes cost of
Annual Costs assoc. with Comm Failures (Materials)	communication equipment and material adders.
	Labor costs associated with communication device failures based on expected failure rates and replacement of equipment at the assets' end of life. Includes installation
	labor, testing labor, and labor escalation.
	Materials costs associated with meter failures and new customer meter growth based on expected failure rate and meter population growth rates. Includes cost of meter
Annual Costs assoc. with Meter Failures & Growth (Materials)	equipment and material adders.
	Labor costs associated with meter failures and new customer meter growth based on expected failure rate and meter population growth. Includes cost of installation
Annual Costs assoc. with Meter Failures (Labor)	labor and labor escalation.

O&M - Recurring Costs	
Description	Definition
Cellular Costs (WAN)	Monthly cellular costs paid to Verizon for cellular backhaul on CGRs and 4G cellular (direct connect) meters
Data Analytics Labor	Additional full-time employees (FTEs) required to perform analytics on AMI data and identify non-technical line loss
AMI Operators Labor	Additional FTEs required to operate the AMI network and Head-End (HE) system, ensuring optimal communications and remote data collection for billing
Billing Labor	Additional FTEs required for data management in the billing department
Telecom Labor	Additional FTE required to manage AMI telecommunications

### User Notes:

1. This worksheet is linked to the Title Block Worksheet for project date information used in Columns J - AF. It looks up Escalation Index information from the [DOE Escalation Rates] tab for Columns R - X. However, you can manually enter in Escalation % information in Columns R - X if you chose to utilize Escalation data from an alternate source.

All data fields that are "blue" font, must be keyed in manually. All other fields are formulas. All items to be Escalated must be keyed manually due to the fact that no two projects will escalate costs in a like manner.
 This sheet is "Optional". It can be used in lieu of keying the Escalation %'s by Work Phase/WBS/Task ID on the Detail Summary Sheet.

## Project Name: DEP - AMR to AMI Deployment

## DEP AMI Benefit Details

All benefits reflect the AMI meter deployment schedule at the time of the initial cost-tocomplete analysis and savings were adjusted for inflation. In addition, the benefits align with the expected 15-year service life of the meters. Benefits are scaled up during deployment years based on the deployment schedule and benefits are scaled down as meters reach the end of their expected life.

### Reduced Meter Reading Costs

Reduction in drive-by (AMR) and manual meter reading costs enabled by AMI remote reading functionality.

The calculated Meter Reading savings were derived from the DEP Meter Reading budget and reflect that the quantity of reads per meter reader will decrease as AMI is deployed. Thus contract meter read costs are expected to increase per unit by approximately 25% as meter read volumes decrease and geographic dispersion increases. Actual budget impact modeled to lag installation by 6-12 months.

## Field Metering (Temp to Capital)

• Field Metering labor allocated to the deployment project will shift O&M dollars to capital project dollars.

### **Reduced Meter Operations Costs**

- Reduce testing/repairs during deployment years & eliminate costs of manual metering reading equipment (handheld maintenance, etc.)
- Comprised of 3 components:
  - o Reduction in Meter Testing
  - o Reduction in Meter Repair Work
  - Reductions in Meter Reading Equipment costs
- Benefit derived from Meter Operations budget and expected Meter Reading Equipment costs.

## Customer Order Cost Reduction

- Reduced customer order field visits for disconnect/reconnect and succession reads as these tasks are automated via AMI Remote Order Fulfillment (ROF) functionality
- Drivers:
  - Off-cycle read orders performed remotely

- Disconnects/reconnects performed remotely
- Inputs:
  - Utilized average annual remote capable customer orders based on based on 2year completed order volumes by order type .
  - Unit order cost (truck roll) was based on 2016 Contract Pricing and 2016 & 2017
     YTD average cost by order type.
  - Impact was modeled to lag installation by at least 6 months to allow for meter certification and network optimization
- Variables:
  - # average annual remote capable orders completed by contractors
  - # average annual remote capable orders completed by employees
  - $\circ~$  % of total meters with Remote Disconnect Switch (RDS) based on meter form quantities in scope
  - o % of AMI eligible meters within total meter population
  - % of historical ROF success rates
  - Customer Orders overtime budget

## Customer Order Cost Reduction (DNP)

- Reduced customer order field visits for non-pay disconnect (NPD) assuming that customer notification regulations can be changed by 2019, allowing for non-pay disconnect orders to be automated via AMI Remote Order Fulfillment (ROF) functionality.
- Drivers:
  - Non-pay Disconnects performed remotely
- Inputs:
  - Utilized average annual remote capable NPD orders based on based on 2-year completed order volumes by order type.
  - Unit order cost (truck roll) was based on 2016 Contract Pricing and 2016 & 2017
     YTD average cost by order type.
  - Impact was modeled to lag installation by at least 6 months to allow for meter certification and network optimization
- Variables:
  - # average annual remote capable NPD orders completed by contractors
  - o # average annual remote capable NPD orders completed by employees
  - % of total meters with Remote Disconnect Switch (RDS) based on meter form quantities in scope
  - o % of AMI eligible meters within total meter population
  - % of historical ROF success rates
  - Customer Orders overtime budget

## Cellular Cost Reduction (SSN Access Points)

- Reduced monthly cellular costs resulting from the removal and decommissioning of Silver Springs Network (SSN) Access Points (AP's)
- Utilized average monthly cellular costs based on 2-year billing history actuals for SSN Access Points
- Variables:
  - Average monthly cellular costs associated with SSN AP's
  - o # SSN AP's
  - Projected removal schedule

## Reduced Restoration Costs – OK on Arrival:

- Reduced truck rolls required to verify voltage to meter due to ability to remotely verify
- Monthly trouble orders resulting in "ok on arrival" were queried from DOMS (2016)
- Assessed trouble orders resulting in "ok on arrival" by Contractor v. Companycompleted orders
- Average unit order cost (truck roll) was based on 2016 Contract Pricing, 2017 Level 1 company labor rate, 2017 Company Fleet rate, and Company v. Contractor-completed orders.
- \$ Savings = Average yearly orders X % reduction X Average Unit Cost per order X inflation % X benefit realization %
- Assumed: 90% reduction, \$54.61/order average for labor & fleet
- Impact was modeled to lag installation by at least 6 months to allow for meter certification and network optimization

## Reduced Restoration Costs – Major Storms:

- Reduced truck rolls required to verify voltage to meter due to ability to remotely verify.
- This benefit was scaled from an AMI project model based on previous AMI deployments. The benefit was allocated on a per meter basis, then multiplied by the number of AMI meters planned for DEP.
- The benefit model included:
  - $\circ$   $\;$  Trouble orders resulting in "ok on arrival" queried from DOMS  $\;$
  - \$ Savings = ((Labor Cost + Outside Labor Costs) / Number Days Storm Lasted)
     X Days reduced by AMI X Benefit Realization %
  - Assumed: ½ day reduction, 3 year average actual labor costs

## Miscellaneous O&M Savings

- Includes nominal amounts to represent other enabling benefits such as :
  - $\circ$   $\;$  Improved vegetation management (voltage sag data from meters)

- Reduced customer calls (e.g. reduce repeat calls for start service and reconnect non-pay due to Remote Order Fulfillment functionality and scheduling capabilities)
- Reduced estimated bills

### Miscellaneous Capital Savings

- Includes nominal amounts to represent other enabling benefits such as:
  - Improved asset management (aggregate meter data to identify over/under loaded distribution transformers, and stress points in the grid)
  - o Ability to leverage meter Volt/Var data to improve placement of capacitor banks

## Non-technical Loss Reduction:

- This benefit item represents expected revenue capture during and after the AMI deployment as a result of the increased ability to identify cases of non-performing or under-performing ("slow/stuck") meters from registration erosion, power theft and pilferage by way of either direct tapping, manipulating, or bypassing the meter, non-reading of meters, and misconfigured equipment and installation errors such as miswiring, incorrect application of multiplying factors, and defects in CT & PT circuitry.
- Identification of meter or usage irregularities through data analytics and field investigations within operations and during deployment
- Variables:
  - o DEP Annual Revenues
  - Revenue Leakage Percentage "Non-Technical Line Loss": 2% (From EPRI 1016049: Advanced Metering Infrastructure Technology, Limiting Non-Technical Distribution Losses in the Future)
  - AMI Enabled Identification: 50% (Potential revenue erosion to be identified by AMI deployment and current analytics capabilities. Further advanced analytics initiatives required to identify remaining 50%. Based on assumptions of the Duke Energy Analytics and Revenue Protection team)
  - AMI Recovery Gain: 80% (Potential recovery gain)
  - Collection Percentage (Amount to be collected from identified revenue erosion through corrective action and back-billing): 60%
  - Benefit Realization (based on the deployment rate)
- \$ Savings = Annual Revenue X Non-Technical Line Loss % X AMI Enabled Identification X AMI Recovery Gain X Collection % X Benefit Realization %

## **Reduced Legacy Meter Failures:**

• Full cost of new meter failures captured in project costs. This is full benefit of reduced meter failures due to deployment of new AMI meters (old meters vs. new AMI meters).

- Inputs:
  - 3-year average meter failures in DEP by failure reason was provided by the Metering Services team
  - Cost of average fully burdened AMR meter: \$34.14 + 15% material adders = \$39.26
  - Average installation labor cost = \$25
  - Material cost inflation assumed at 1%, Labor inflation assumed at 3%
     Growth in Failure Rate of old meters assumed at 0.03%
- \$ Savings = ((Cost of meter X (1+Material Inflation)) + (Cost of installation X (1+Labor Inflation))) X (annual failure rate X (1+Failure Growth Rate)) X Benefit Realization %

5

Cellular Cost Reduction (SSN Access Points)	-	-	14,715	58,860	117,720	121,252	124,889	128,636
Outage Restoration Cost Reduction - OK on Arrival	-	50,672	224,426	430,062	548,168	570,316	587,426	605,048
Outage Restoration Cost Reduction - Major Storms	-	60,000	293,550	810,900	981,000	1,010,430	1,040,743	1,071,965
Miscellaneous O&M Savings (e.g. Call Center)	-	35,206	372,771	873,113	1,058,007	1,089,747	1,122,440	1,156,113
Miscellaneous Capital Savings	-	11,735	124,257	291,038	352,669	363,249	374,147	385,371
Non-Technical Loss Reduction	-	1,679,758	7,259,075	13,572,782	16,880,299	17,136,061	17,221,742	17,307,850
Reduced Legacy Meter Failures	-	13,089	57,303	108,559	139,333	143,351	147,652	152,081
Total Benefit	-	2,978,888	11,762,918	22,136,890	27,838,842	28,477,194	28,903,108	29,339,658

Savings reflect AMI deployment schedule at time of business case development (May 2017)

Average annual unit costs and volumes are based on DEP-specific data

3% labor inflation applied annually unless otherwise noted

Benefits do not include customer programs enabled by AMI (Enhanced Customer Solutions)

Benefits align with the expected 15-year service life of the meters. Benefits are scaled up during deployment years based on the deployment schedule

and scaled down as meters reach the end of their expected life.

### **Metering Benefits**

Savings	2017	2018	2019	2020	2021	2022
Meter Reading	\$0	\$0	\$400,000	\$850,000	\$3,120,000	\$3,213,600
Metering (Temp to Capital)	\$0	\$975,000	\$1,400,000	\$1,400,000	\$0	\$0
Meter Operations	\$0	\$25,000	\$100,000	\$100,000	\$0	\$0

Savings provided by Everett Greene (Director of Meter Reading) and Nabil Benwahoud (Director of Field Metering) 5/10/2017

Savings derived from Meter Reading and Field Metering budgets and reflect that the quantity of reads per meter reader will decrease as AMI is deployed

Assumes contractor meter read costs are expected to increase per unit by approximately 25% as meter read volumes decrease and geographic dispersion increases Actual Meter Reading budget impact modeled to lag installation by 6-12 months

3% inflation applied beginning in 2021
